

A clearer patient journey

Reception, doctor scheduling and operation theatre coordination in one simple system

Proposal for the Department of Anaesthesiology

Current patient • live status • visible across the waiting area

The coordination challenge

Reception, doctors and the OT desk currently depend on separate paper steps and verbal updates.

- | | | |
|----|---------------------|---|
| 01 | Reception | Records the patient and prepares a paper token and form |
| 02 | Doctor | Reviews the patient and decides a future operation date |
| 03 | OT desk | Runs tomorrow's list and updates the live status |
| 04 | Waiting area | Needs a clear, silent view of current and upcoming patients |

One patient record from reception to completion

03

Every OT patient begins with an authorised reception record. No duplicate typing and no image recognition are required.

Reception entry stays short and familiar

SPECIAL NOTE / PRE-ANAESTHETIC ADVICE:

Anaesthesiologist (Rank & Name / Signature)

Token

The patient receives a compact barcode token with a large visible number.

Anaesthesia form

Reception keeps the two-page form. Patient details are pre-filled and clinical sections remain blank for handwriting.

The doctor controls the operation date

The system never decides who will receive surgery or when it will happen.

What improves for each group

1

Patients

A clear token and visible queue reduce uncertainty while waiting.

2

Reception

One short entry creates the record, token and paper form.

3

Doctors

The original record stays available when the operation date is chosen.

4

OT team

The live roster and wall display follow the same status update.

The software supports the existing clinical process. It does not replace professional judgment.

Deployment inside the CMH network

11

Operational safeguards

Controlled access

Separate roles for reception, doctor, OT control, display and administration

Traceable changes

Audit records preserve who changed important information and when

Printing continuity

A printer problem never removes the patient record. Staff can reprint later

Data protection

Local deployment, secure passwords and daily approved backups

Before production use: confirm the CMH network, backup location, user list and HTTPS policy with the IT head.

PROPOSED NEXT STEP

Approve a controlled departmental pilot

The pilot can confirm the workflow with staff before any production rollout.

- 1 Nominate the reception, doctor and OT representatives
- 2 Confirm the private network and Windows server location
- 3 Select the token printer, paper size and A4 printer queues
- 4 Test with demonstration records before live patient use

Decision requested

**Permission to run
a staff-reviewed
pilot using
synthetic records**
